Thanks for your work.
But it still don't works.
There are 2 problems:

printjob.document.type can not be set (document is read only, only getter, but no setter).

So i have changed to a new attribute: printjob.typeToPretend.

But there was still a timing problem: the pi function which sets the type, calls back AFTER the job was send to the printer, because it waits for a response from the printer, which takes time, while the script still has gone forward and sent the job...

This is the code for the "onPrintRequested" Listener which works for me:
